

Value Stream Mapping Training & Facilitation

Value Stream Mapping, also known as “material and information flow mapping”, is a lean management tool to identify waste, reduce process cycle time and implement process improvement. A value stream can be defined as all the steps – both value-added and non-value added – required to take a product or service from its raw materials state to a finished product shipped to the customer. Value stream mapping creates a solid continuous improvement implementation plan that will maximize available resources and help ensure materials and time are used efficiently.

Developing a current state Value Stream Map allows you to identify where there are gaps, inefficiencies, and undesirable activities in your current processes to develop an ideal best practice future state map. Value Stream Mapping focuses on “Doing the Right Things” to reduce or eliminate non-value-added activities and bring value added activities to the forefront.

The Benefits of Value Stream Mapping

- **Benefit #1**
Identifies wastes occurring within the entire process sequence from supplier to customer
- **Benefit #2**
Helps develop a prioritized approach to eliminate wastes
- **Benefit #3**
Improved process efficiency by determining task time, lead time and cycle time between each point along the process, distinguishing value-added vs. non-value-added activities

- **Benefit #4**
Aligns cross-functional teams for greater buy-in on improving the core processes that generate revenue
- **Benefit #5**
Provides a focal point for conversation related to the future vision of the company and establishes shared goals for growth
